Encryption Allows Customers to Comply, Control, and Protect Their Critical Data in the Azure Cloud

"By working with Microsoft, we are making it simple for customers to deploy a robust encryption framework, allowing them to move to the cloud with confidence and providing enhanced security without compromising convenience." – Todd More, VP of Data Encryption Product Management, Gemalto

▪ SITUATION

Businesses increasingly require elastic cloud services to run business-critical applications, but security and compliance remain top concerns. The ability to easily implement strong data protection and security in the cloud is a major factor for companies considering moving their sensitive workloads. Gemalto needed a service that would protect highly regulated data and allow for accountability.

▪ SOLUTION

Microsoft Azure provides the secure, elastic cloud services required. With the availability of SafeNet ProtectV in the Azure Marketplace, Gemalto and Microsoft deliver a simple and easy way to protect sensitive and highly regulated data in the cloud. By encrypting entire Virtual Machines instances and attached storage volumes, SafeNet ProtectV allows customers to separate security administration duties, enforce granular controls, and establish clear accountability with audit trails and detailed compliance reporting.

▪ BENEFITS

Microsoft Azure enables Gemalto to deliver its cloud-based data encryption solution with flexible pay-as-you-go subscriptions.

Azure offers full encryption capabilities that allow for accountability and clear tracking of audit trails.
