

SafeNet ProtectV for Microsoft Azure

SAFENET PROTECTV

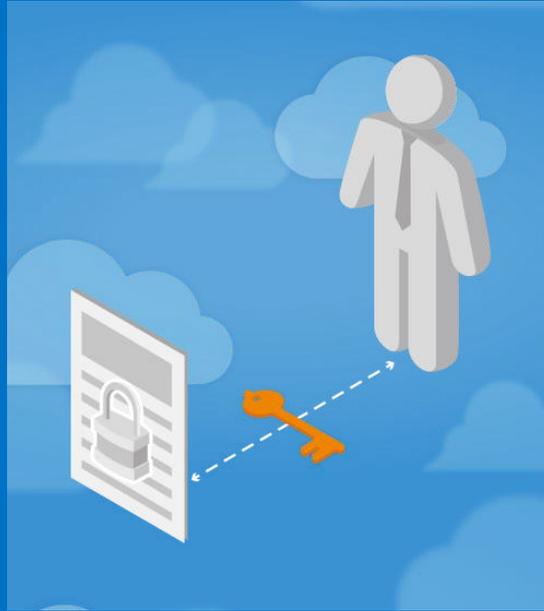

SafeNet ProtectV secures data on Microsoft Azure by encrypting entire virtual machines instances and attached storage volumes to ensure complete isolation of data and separation of duties. This enables enterprises across many verticals, including major financial institutions and governments, to securely migrate even the most sensitive and highly regulated data to Microsoft Azure.

SafeNet ProtectV allows customers to encrypt and protect data on Microsoft Azure while maintaining compliance and achieving high levels of data protection.

STAY COMPLIANT IN THE CLOUD

SafeNet ProtectV gives data control squarely to the customer and lets them demonstrate undisputed command and proof of ownership for both data and keys.

Addresses compliance standards for cloud environments such as PCI DSS, SOX, and HIPAA.

Centralized policy enforcement provides a single audit point to facilitate proof of governance – a key factor in compliance.

MIGRATE SECURELY TO THE CLOUD

SafeNet ProtectV helps customers maintain full control of their data throughout migration to Microsoft Azure by encrypting entire virtual machines and all of the data residing in the instance.

Once encrypted, all archives, snapshots, and backups of these instances remain secure regardless of their location.

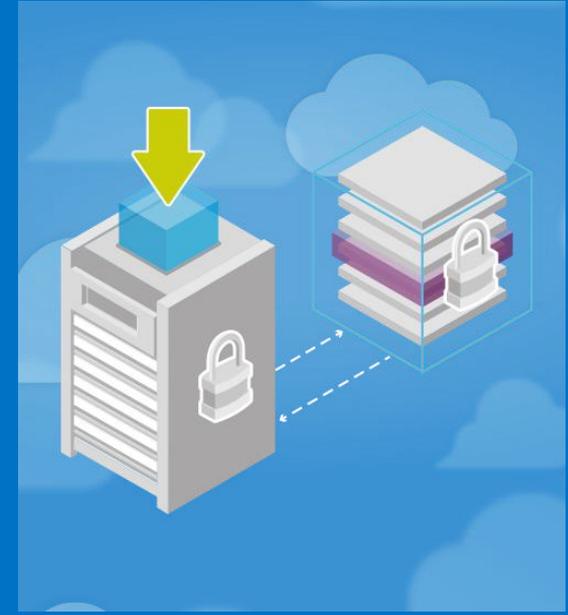

Illegitimate or hidden copies of data are rendered useless, and trusted audit logs cover access events.

INSTANCES ARE ONLY AVAILABLE TO AUTHORIZED USERS

SafeNet ProtectV provides encryption-based separation of duties that isolates data from Microsoft Azure, organization's IT administrators, and different business units within the organization's virtual environment.

Granular role-based control of who can start a virtual instance with pre-boot authentication.

Copies and snapshots of Virtual Machines instances are tracked and impossible to instantiate without authorized access.
